

PHOSURE

PHOSPHATE STABILIZER

Developed to create consistent nutrient uptake of applied fertilizers, creating a better return on the fertilizer investment.

HOW IT WORKS

It is a lightly charged polymer that protects phosphates from tie up, while also increasing the uptake of other nutrients by mimicking carboxyl groups naturally found in Humic and Fulvic acids.

ADVANTAGES

Increases yield compared to fertilizer treatment alone.

APPLICATION

20oz's/acre applied with banded fertilizer, and up to 2 qts/acre can be use in low performing soils.

See product label for complete usage rates.

-  Helps prevent phosphate tie up
-  Increases uptake by the plant
-  Greater ROI
